Output power at preset position		μ W	(400)	

NOTE: Nominal specs represent the design specs; all units should be able to approximate these -- some will exceed and some may drop slightly below these specs. Limit specs represent the absolute worst conditions that are considered to be acceptable; in no case should a unit perform to less than within any limit spec.

DISASSEMBLY INSTRUCTIONS

 Removal of the Cabinet Remove five Screws from the Bottom Cabinet as shown in Figure A.

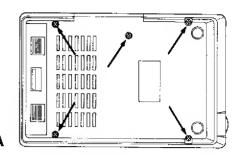

Figure A

Removal of the P.C. Board
 Remove three screws from the Main P.C. Board and
 one screw from the Volume Control Knob. (Figure B-1).
 Remove two screws from the Volume Control
 Fiugure B-2).
 Remove two screws from the Small P.C. Board
 (Figure B-3).

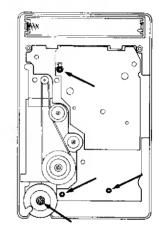

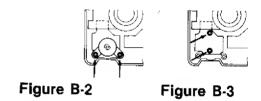

Figure B-1

 Removal of the Tape Mechanism Assembly Remove three screws from Tape Mechanism Ass'y (Figure C-1).
 Open the Cassette Door. Remove the two screws shown in Figure C-2.

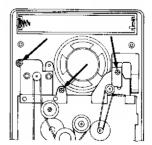

Figure C-1

Note: Rotate the supply reel so that the claws on the supply reel shaft are not caught by the Top Cabinet.

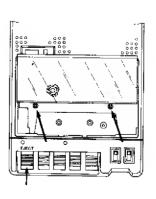

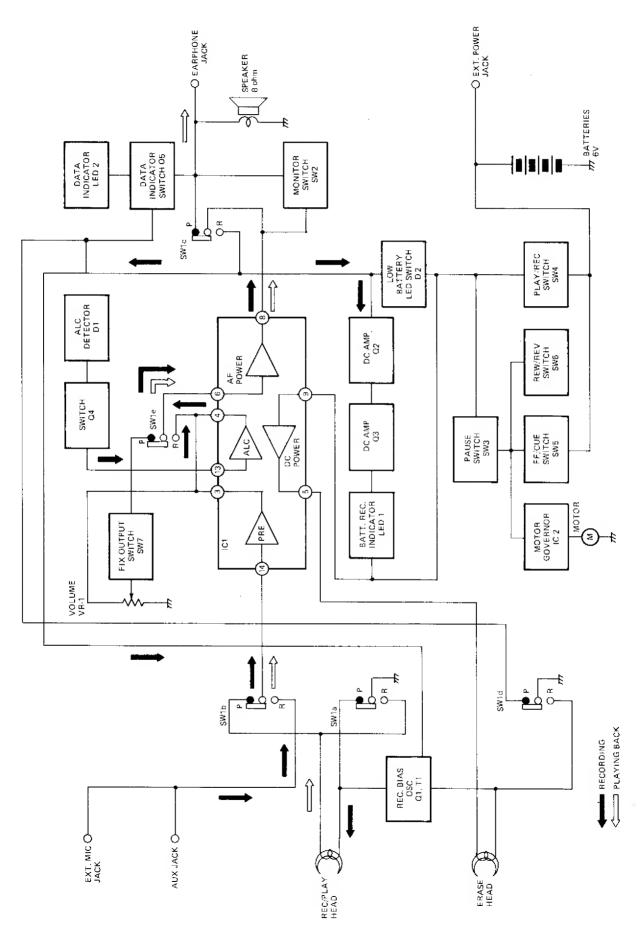

Figure C-2

BLOCK DIAGRAM

CIRCUIT DESCRIPTION

General

The CCR-82 is a computer cassette tape recorder which consists of an ALC (Automatic Level Control) circuit, electronic governor circuit, recording circuit and playback circuit. Almost all of these circuits are contained in one IC (IC1). Power is supplied by four C size batteries (or a power adapter for 6V DC). Refer to the **BLOCK DIAGRAM** and **SCHEMATIC DIAGRAM** as you read the following descriptions.

Recording Circuit

In the recording mode, the audio signal input from the EXT. MIC Jack, JK5 (or AUX Jack, JK3), is coupled through SW1b and C2 to pin 14 of IC1. This then starts the motor. The audio signal is amplified by pre amp (inside IC1). The output is fed through C8, R8, R9, SW1e and C10 to pin 6 of IC1. The signal is amplified by the REC amp (inside IC1). The REC amp signal is output from pin 8 of IC1. The recording signal goes through C19, SW1f, C15/R15 and is fed to the R/P head via an AC bias circuit (consisting of T1 and Q1).

The input signal of the REC amp (pin 6 of IC1) is controlled by the ALC circuit. The output from pin 8 of IC1 goes through C19, SW1f and is fed to D1 (ALC Detector). The ALC circuit consists of D1, R14, C14 and IC1. When the recording signal increases, D1 rectifies the signal. At this time, C14 is charged and, thus, ALC (inside IC1) is enabled. As a result, pin 4 of IC1 is shorted to GND. Hence, ALC adjusts the recording signal to the pertinent level. The output signal of the REC amp (pin 8 of IC1) goes through C19, SW1f, R33, C29 and is fed to the RECORD/LOW BATTERY indicator control circuit. This circuit consists of D2, Q2, Q3 and LED1. The REC signal is amplified by Q2, and Q3 is switched on and off, in accordance with the magnitude of signals amplified by Q2. When Q3 is on, LED1 lights up. As a result, the RECORD/LOW BATTERY indicator (LED1) blinks. When battery voltage is down, D2 turns on and Q3 is kept on. Hence, LED1 lights up. In the recording mode, Q4 circuits eliminate remnant sound during motor start and stop.

Playback Circuit

In the playback mode, a signal from the R/P head is fed through SW1b and C2 to pin 14 of IC1. Pin 14 is the input of an equalizer amp (inside IC1). Pin 3 of IC1 is the output of an equalizer amp (inside IC1). The output signal is coupled through C8, R8, R36/VR1, SW1e, C10 to the audio power amp circuit input. (pin 6 of IC1). Pin 8 of IC1 is the output of the amp. Hence, the audio power amp drives an 8-ohm load. Output from pin 8 of IC1 goes through C19, SW1f, R37, C33 and is fed to the DATA indicator control (Q5 and LED2). When a computer loads data, LED2 blinks (Q5 switches on/off).

Electronic Governor Circuit

The electronic governor circuit consists of IC2, R23-25, VR3 and the motor. The governor circuit utilizes the counter-EMF voltage of the motor to control its revolution speed, detecting the revolutions with a bridge circuit. The equivalent circuit of a DC motor consists of internal resistance (of the motor) and counter-EMF voltage of the motor.

Figure A is the equivalent circuit of DC motors. In Figure B, when the bridge circuit, having the motor as one of its elements reaches a balance condition (rm x $r2 = R24/R25 \times r4$), the voltage at the detection terminal (between pin 2 and pin 4) is proportional to the revolution of the motor. Therefore, when the servo is applied as illustrated to keep the value of the voltage constant (between pin 2 and pin 4), the revolution is maintained constant by applying the principle of electronic control (IC2) of the motor.

rm: Internal resistance of motor

em: Counter-EMF voltage of motor

R24/R25: Parallel resistor

r2, r4: Internal resistance of IC2

Vd: Voltage at bridge detection terminal

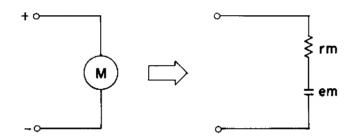

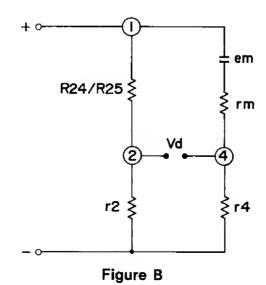

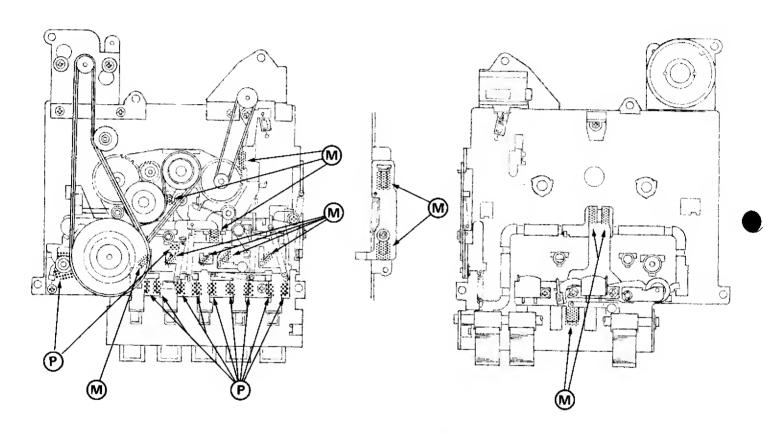

Figure A

STANDARD MAINTENANCE

Whenever a unit is brought in for service or repair, it should be cleaned and lubricated and the head should be demagnetized.

- 1. Cleaning: Clean the heads and all tape handling surfaces using alcohol and cotton swabs. Wipe dry.
- 2. **Demagnetization:** Do not use magnetized tools near the head, since they can magnetize the head. With normal use, the head will retain small amounts of residual magnetism (this results in increased noise and loss of high-frequency response). Use a standard tape head demagnetizer to demagnetize the head.
- 3. Lubrication: Use a high grade of specially formulated grease (do not use oil) on the sliding surfaces indicated with por in the figures below. Lubrication is normally required only when parts tend to bind, or after long periods of use. Use all lubricants very sparingly and avoid contact with other parts.

P: SSSS Grease for Plastic

M: Grease for Metal

Figure 1-A

Figure 1-B

CIRCUIT ADJUSTMENT

Adjustment of the Tape Speed

Load the unit with a 3 kHz test cassette tape, tape such as MTT-111. Use a Frequency Counter connected to the audio output across an 8-ohm speaker. Adjust the 200 Ω (VR3) Variable Resistor so the Frequency Counter reading is 3,000Hz +0.33 — +0.67%.

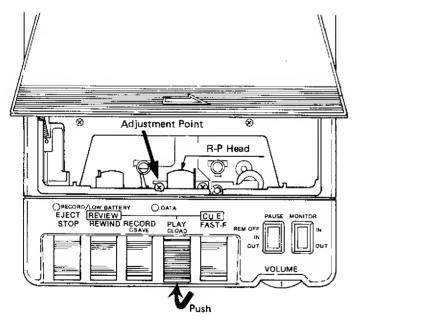

Adjustment of the Recording Bias

Adjust VR2 so that the Audio Voltmeter indicates 80 mV RMS (voltage across R3) with a 50-52 kHz test frequency at T1.

Head Adjustment

Pre-adjustment Procedures

- 1. Be sure to demagnetize and clean the head before proceeding with the Head Adjustment.
- 2. For the Head Adjustment, never use a magnetized screwdriver.
- 1. Connect a VTVM to the Earphone Jack.
- 2. Use 8-ohm dummy load when the VTVM is plugged into the Earphone Jack.
- 3. Load a 6.3 kHz test tape MTT-113 into the unit. Turn Azimuth Adjusting Screw for a gauge. A take-up torque of 30-65 gcm is required (Figure 3).
- 4. After adjustment, secure the Azimuth Adjusting Screw with glyptol or "screw lock".

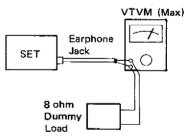

Figure 2

MECHANICAL ADJUSTMENT

General Remarks

Before attempting to adjust the mechanism of this unit, use a piece of soft cloth soaked in alcohol to wipe clean the tape contacting surfaces (i.e., the tension pick-up, pinch roller, playback head and capstan), as well as the contact surfaces of the driving parts (i.e., the motor pulley, flywheel, take-up reel, supply reel, rewind pulley and FF Gear). Grease stains may cause trouble.

Take-Up Torque Adjustment

- 1. Set the unit in the playback mode and measure the torque of the take-up reel with a torque gauge. A take-up torque of 30-65 gcm is required (Figure 3).
- 2. If a torque of 30-65 gcm cannot be obtained, replace either the take-up reel or forward clutch assembly.

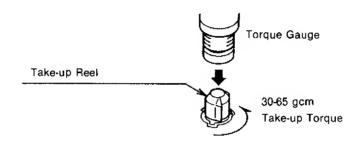

Figure 3

Fast-Forward and Rewinding Torque Adjustment

With a cloth soaked in alcohol, wipe clean the contact surfaces of the take-up reel, supply reel, FF pulley and center pulley.

Dirty surfaces will cause slippage.

- 1. Measure the F-FWD torque value. Torque of more than 45 gcm is necessary for fast-forward operation (Figure 4).
- 2. If the fast-forward torque is not adequate (required fast-forward torque: over 45 gcm), replace either the take-up reel center pulley or the FF pulley.
- 3. Measure the rewinding torque value. Torque of more than 45 gcm is necessary for rewinding operation (Figure 5).
- 4. If the rewinding torque is not adequate (over 45 gcm), replace the supply reel and/or the center pulley.

Figure 4

Figure 5

Auto Shut-Off Adjustment

The auto shut-off mechanism automatically switches off the unit at the end of a tape during playback or recording operation.

- Set the unit in the playback mode.
 Apply a tension gauge to the tension pick-up as illustrated (Figure 6).
 Push the gauge in the indicated direction and measure the force required for shut-off to occur.
- 2. The tension pick-up sensitivity should be set properly so that the auto shut-off works and switches off the unit when the tension gauge reads 40 to 80g (reference: 60g).
 If the auto shut-off works and switches off the unit at a tension pick-up force of less than 40g, either bend the spring hook to increase its force or replace the spring.
 - If a tension pick-up force of more than 80g is required to shut-off the unit, check the auto shut-off mechanism as outlined below.
 - 1) Check to see if the sensing lever, auto-kick lever and spring are too loose or too secure (Figure 7).
 - 2) If you don't locate the difficulty by checking the parts listed above, replace the spring.

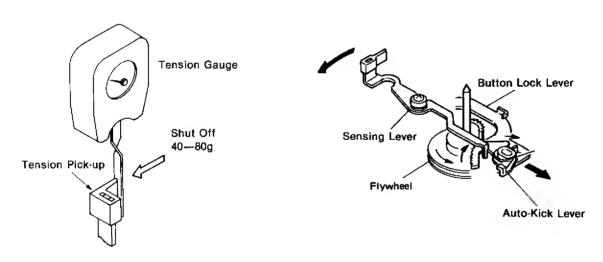

Figure 6

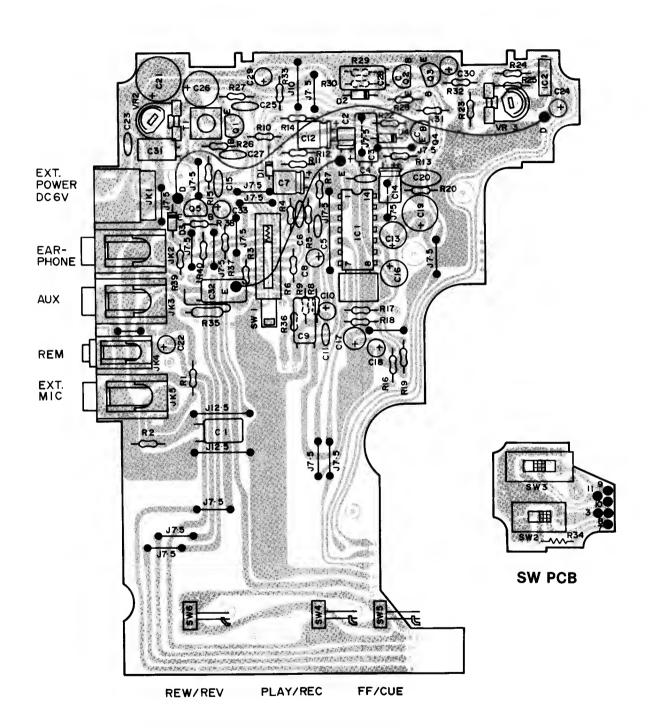

Figure 7

TROUBLESHOOTING CHART

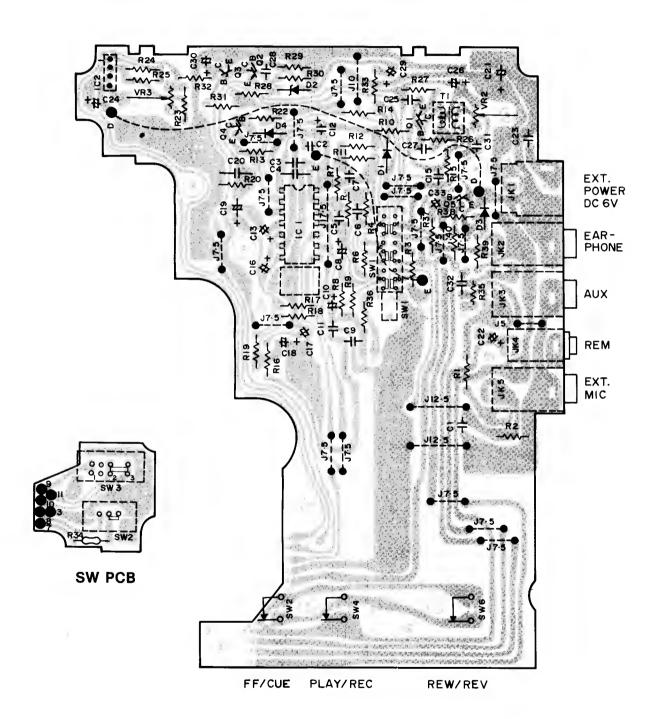

SYMPTOM	CAUSE AND REMEDY				
Unit Does Not	1) Motor does not function:				
Function.	Replace.				
	2) Main belt slipping:				
	Replace.				
	3) SW4 poor contact:				
	Adjust or replace.				
	4) Defective EXT. Power Jack (JK1):				
	Repair or replace.				
No Take-up of Tape	Take-up reel ass'y and center gear slipping.				
The tame ap of tape	Wipe off take-up reel ass'y and center gear.				
	2) Pin roller ass'y slipping:				
	Wipe off pinch roller ass'y. Change the spring location or replace				
	pinch roller spring.				
Will Not Fast-Forward	RF clutch arm ass'y, center gear or supply reel ass'y slipping:				
or Rewind	Wipe off RF clutch arm ass'y, center gear or supply reel ass'y.				
	2) Defective SW5 or SW6:				
	Repair or replace.				
	3) IC2 defective:				
	Replace.				
Excessive Wow	1) Motor defective:				
	Replace.				
	2) Pinch roller ass'y defective:				
	Replace.				
Varying Speed	1) Main belt slipping:				
	Wippe off flywheel capstan and motor pulley or replace main belt.				
	2) Motor defective:				
	Replace.				
	3) IC2 defective:				
	Replace.				
	4) Improper adjustment of VR3:				
	Make readjustment.				
No Playback	R/P head defective or open:				
•	Replace.				
	2) R/P head dirty:				
	Wipe off R/P head with a cloth moistened with alcohol.				
	3) Lead wire to R/P head open:				
	Replace lead wire.				
	4) No power to Amplifier (IC-1):				
	Replace SW4.				
	5) Defective components in Amplifier (IC-1):				
	Check and replace the defective components.				
	2.121. Sita ropiado tito adroditro dellipolicito.				

SYMPTOM	CAUSE AND REMEDY				
Low Playback or Distorted Playback	 Amplifier (IC-1) defective: Check and replace the defective components. R/P head dirty: Wipe off R/P head with a cloth moistened with alcohol. R/P head worn out: Replace. 				
No Record	 R/P head defective or open: Replace. Components in Amplifier (IC-1) defective: Check and replace the defective components. EXT. MIC Jack (JK5) defective: Repair or replace. R/P head dirty: Wipe off R/P head with a cloth moistened with alcohol. Poor contact in AUXiliary Jack (JK3): Repair or replace. SW4 defective: Repair or replace. 				
No Erase	1) Erase head defective: Replace. 2) Lead wire to erase head poorly soldered: Re-solder lead wire.				
No Load	 REM Jack (JK4) defective: Repair or replace. Defective PAUSE Switch (SW3): Repair or replace. Improper adjustment of VOLUME (VR1): Make readjustment. Defective PRESET Switch (SW7): Repair or replace. Poor contact in EARPHONE Jack (JK2): Repair or replace. 				
No Save	1) Poor contact in AUXiliary Jack (JK3) or MIC Jack (JK5): Repair or replace. 2) Defective SW1: Replace.
